

Appendix 3. Inflation Impact & Comparison Analysis

Key takeaways

- The SIP restores the coinbase block reward to 1,000 STX per Bitcoin block and removes the SIP-029 reduction schedule, putting 2026 inflation at 7.82%.
- Inflation stays at ~7.8% in 2026-2027, then declines every year to 2.14% by 2031, as SIP-031 emissions wind down.
- The proposed issuance sits below the 5-year median (8.17%) and modestly above the 2025 median (6.57%), and well below the top 50 average, both the 2025 average (15.9%) and the 5-year average (25.1%).

Impact of changing coinbase block rewards

The SIP restores the coinbase block reward to 1,000 STX per Bitcoin block and removes the reduction schedule established under SIP-029. This returns the network to a stable issuance floor, with no further reductions planned. The effect on inflation is contained. At 1,000 STX/block, 2026 inflation is 7.82%, and it declines over the following years as the SIP-031 endowment emissions wind down.

Inflation trajectory 2026-2031

Year	Inflation
2026	7.82%
2027	7.85%
2028	6.31%
2029	5.23%
2030	3.69%
2031	2.14%

Inflation peaks in 2026-2027 at ~7.8%, then declines steadily to 2.14% by 2031. This decline is driven by SIP-031 endowment emissions, which fall from ~89.8M STX in 2026 to zero in 2031. In 2031, once SIP-031 is complete, only the 1,000 STX/block coinbase remains, corresponding to 2.14% annual inflation.

Comparison with other ecosystems

Chain	2025 emission
Ethereum	0.20%
Avalanche	4.97%
Stacks - proposed (1,000)	7.82%
Polkadot	8.61%
Tron	9.86%
Hedera	11.47%
Solana	16.75%
Cosmos	24.46%
Sui	26.17%
Aptos	34.47%
Celestia	81.55%
2025 emission - Top 50 average	15.9%
5-year emission - Top 50 average	25.1%
2025 emission - Top 50 median	6.57%
5-year emission - Top 50 median	8.17%

Compared with the top 50, the proposed issuance remains well below both averages, the 2025 average (15.9%) and the 5-year average (25.1%). Against the medians, it sits modestly above the 2025 figure (6.57%), at the 52nd percentile, with 24 of the 50 chains carrying higher inflation, and falls below the 5-year median (8.17%).

2026-2027 are the highest-inflation years of the schedule. Even at that peak, the network stays below the 5-year median, and from 2028 onward inflation declines every year, moving further below it.

Conclusion

This SIP establishes a stable, predictable coinbase of 1,000 STX/block, with no scheduled reductions. This supports both network security and the Bitcoin Staking yield mechanism, on a network where coinbase emissions alone amount to only about 2% inflation over the long run.

Even at its highest, in 2026-2027, the proposed issuance stays below the peer median and well under the peer average. From 2028 it declines year after year, and is calibrated to remain healthy over the long term.
